

Criteria for Pediatric **PRIORITY I** Activation Response

Applies to ALL Trauma from scene or transferred patients age ≤ 16

Priority I Criteria

REQUIRED RESPONSE: FULL TRAUMA TEAM ACTIVATION

Trauma Attending presence within 15 minutes

1. Confirmed blood pressure less than 90 mmHg at any time in adults and age-specific hypotension in children
2. Penetrating mechanism (gunshot or stab wounds) to the neck, head, or torso (chest, abdomen, back, pelvis)
3. GCS less than 9 with **TRAUMA MECHANISM** (Not just found down)
4. Transfer patients from other hospitals requiring ongoing blood transfusion to maintain vital signs
5. Patients presenting with quadriplegia or paraplegia
6. Patients intubated in the field and directly transported to the trauma center
7. Patients who have respiratory compromise or are in need of an emergent airway
8. Transfer patients from another hospital with ongoing respiratory compromise (excludes patients intubated at another facility who are now stable from a respiratory standpoint)
9. Tourniquet in place to control hemorrhage (with or without hemodynamic instability)
10. Transfer with intracranial hemorrhage and midline shift.
11. Emergency physician's discretion.

IF IN DOUBT INITIATE PRIORITY I RESPONSE
